

Killed Animals Timer Calculator — PRD

Problem

Street activists doing vegan outreach have no fast, visual way to quantify the "cost" of the conversation they just had, and no easy way to follow up with the pedestrian without relying on physical cards.

Goal

A mobile-first PWA that:

1. Runs a timer during the conversation.
2. On stop, shows an impactful summary (time, animals killed, breakdown by species, optional comparison to human mass-death events).
3. Captures the pedestrian's email to send them resources and a link back to the site.

Primary user

Activist doing street outreach (owns/runs the tool).

Secondary user

The pedestrian (receives the summary + email form + QR code).

Core user flow (v1)

1. Activist opens the app → big "Start" button.
2. Tap Start → timer begins. Timer must survive screen lock / app backgrounding (implemented via timestamp stored in localStorage, elapsed time always recalculated as `Date.now() - start`, never an incrementing counter).
3. Tap Stop → summary screen: total time, total animals killed, breakdown by species, optional comparison toggle (vs. WWII, Holocaust, COVID, etc. — cite sources, keep this off by default or clearly sourced given it's a sensitive framing).
4. Below summary: activist's personal message (configurable, stored in localStorage, no login needed in v1) + email capture form + QR code linking to the site.
5. Nav to: Why Vegan / How Vegan / FAQ / resources (documentaries, podcasts, influencers, transition guides).

Success metrics (v1 experiment)

- Working, bug-free app in 1 week.
- At least one real activist uses it in the field.
- At least one real email captured.

Scope: MVP (v1)

- Timer start/stop, timestamp-based (survives screen lock/refresh).
- Summary: total time, total animals killed, species breakdown.
- Comparison toggle vs. human mass-death events (sourced).
- Activist personalized message (localStorage config, no login).
- Static content sections: Why Vegan / How Vegan / FAQ / resources.
- Email capture form → sends summary + site link (via Resend).
- Static QR code linking to the site.
- Installable PWA (manifest + service worker via next-pwa).

Out of scope for v1 (→ v2)

- Activist login / auth.
- Per-activist entry history / saved sessions.
- Community-wide aggregate dashboard ("together we've debated X hours").
- Multi-language.
- Social share image of the summary.
- Dynamic per-session QR codes.
- CMS-editable content (v1 content is static/hardcoded or Markdown files).

Tech stack

- **Frontend/backend:** Next.js (App Router) + TypeScript + Tailwind CSS.
- **Persistence (v1):** browser localStorage only — no database needed yet.
- **Email:** Resend, called from a Next.js API route.
- **QR code:** `qrcode.react`, pointing at the static production URL.
- **Hosting:** Vercel, connected to GitHub for auto-deploy on push to `main`.
- **PWA:** `next-pwa` for manifest + installability.
- **v2 additions:** Supabase (Auth + Postgres) for login and entry history.

Data sourcing for death rates

Base species breakdown rates on public methodologies from sources like FAOSTAT, the ADAPTT Animal Kill Counter (open-source methodology), Sentient Media, and Counting

Animals. Keep the rates in a single, clearly-commented config/module so they're easy to update as sources are refined. Cite sources visibly in the UI near the comparison numbers for credibility.

1-week build roadmap (30–60 min/day)

- **Day 1:** Project setup (Next.js + Tailwind), deploy skeleton to Vercel, basic Start/Stop timer with timestamp-based elapsed time in localStorage.
- **Day 2:** Death-rate config module (per species) + summary screen (time, total animals, species breakdown).
- **Day 3:** Comparison toggle (sourced) + activist message/config (localStorage, no login).
- **Day 4:** Email capture form → Next.js API route → Resend.
- **Day 5:** Static QR code + Why Vegan / How Vegan / FAQ content pages (Markdown).
- **Day 6:** PWA setup (manifest, next-pwa), real-device testing of screen-lock survival.
- **Day 7:** End-to-end QA on mobile, polish, final deploy, share with 1–2 real activists for feedback.

Open design note

The comparison to human mass-death events (WWII, Holocaust, COVID) is a real outreach technique but is polarizing with some audiences. Recommend making it an optional toggle, clearly sourced, rather than a forced/default element of the summary.
